(54) Flashlight

(57) Flashlight comprises a base housing forming a power end for the flashlight and having a longitudinally extending bore for receiving at least one battery, a working end housing spaced from the base housing and supporting a light bulb wherein the working end housing includes means defining a longitudinally extending bore, and a flexible core assembly connecting the base housing to the working end housing, and comprising a pair of conductive wires electrically connecting the battery to

the light bulb, a flexible spine and an resilient sleeve (18) containing the spine. The flexible spine includes a plurality of interconnected and universally rotatable members. To at least one end of the flexible core assembly an anchor is connected having a portion extending within the bore of the corresponding housing and this bore includes gripping means sandwiching the sleeve between themselves and the anchor.

EP 0 721 082 A2

Description

This invention relates to a hand-held flashlight and in particular to such a flashlight having a flexible core which may be pulled or twisted relative to a power end housing and/or a working end housing.

A flashlight according to the precharacterizing portion of claim 1 is known from GB-A-218 193.

The flexible core assembly of the prior flashlight enables the flashlight to be bent, coiled or draped into various positions. However, both the torsional and pulling forces applied to the flexible core assembly and to its resilient sleeve as a consequence of the bending, coiling or draping of the flexible core assembly into various positions have a tendency to separate the core assembly and in particular its resilient sleeve from the flashlight housings.

Accordingly it is an object of this invention to prevent the resilient sleeve of a flashlight having a flexible core assembly from being separated from the corresponding housing of the flashlight either through torsional or axial forces and to prevent damage to the flexible core assembly and internal conductors due to excessive torsional action.

The foregoing object and other objects of this invention are attained in a flashlight comprising:

a base housing forming a power end for said flashlight and having a longitudinally extending bore for receiving at least one battery,

a working end housing spaced from said base housing and supporting a light bulb, wherein the working end housing includes means defining a longitudinally extending bore, and

a flexible core assembly connecting said base housing to said working end housing and comprising a pair of conductive wires electrically connecting said battery to said light bulb, a flexible spine and a resilient sleeve containing the spine which flashlight is characterised in that said flexible spine includes a plurality of interconnected and universally rotatable members, that to at least one end of the flexible core assembly an anchor is connected having a portion extending within the bore of the corresponding housing and that this bore includes gripping means sandwiching the sleeve between themselves and the anchor.

The invention will now be described, by way of example only, with respect to the accompanying drawings, in which:

- Figure 1 is a perspective, exploded view illustrating features of the flashlight of the invention;
- Figure 2 is a side elevational view, partially in section, of the flashlight of Figure 1;
- Figure 3 is a side elevational view with portions broken away to illustrate further details of the flashlight;

Figure 4 is an enlarged elevational view illustrating details of a portion of the flashlight of the present invention;

Figure 5 is an enlarged elevational view of a further portion of the flashlight of the invention;

Figure 6 is a perspective view of the flashlight in a somewhat folded position illustrating the manner in which the two housings of the flashlight may be joined together;

Figure 7 is a perspective exploded view of a portion of the flashlight;

Figure 8 is a view similar to Figure 7 showing the parts in their assembled states;

Figure 9 is an exploded perspective view of a further portion of the flashlight;

Figure 10 is an exploded perspective view of a sub-assembly of the flashlight;

Figure 11 is an enlarged sectional view taken along line 11-11 of Figure 12;

Figure 12 is a fragmentary sectional view of a portion of one of the housings of the flashlight illustrating details thereof;

Figure 13 is an enlarged sectional view taken along line 13-13 of Figure 12; and

Figure 14 is an end view taken along line 14-14 of Figure 1.

Referring now to the various figures of the drawings, here is disclosed a preferred embodiment of the present invention. In referring to the various figures of the drawings, like reference numerals shall refer to like parts.

Referring specifically to Figure 1, there is disclosed a flashlight 10 having a first housing 12 and a second housing 14. Housings 12 and 14 are spaced apart and are connected together through a flexible core assembly 16. Housing 12 serves as the power end of the flashlight and contains therewithin batteries 78 and 80 (see Figure 2) used as the primary source of electrical power for the flashlight. Batteries 78 and 80 may be standard C-cells.

Housing 14 functions as the working end of flashlight 10 and includes a bulb 92. As shown in Figure 2, housing 14 also has mounted therewithin reflector 90 and lens 50. A switch 20 is provided to selectively connect bulb 92 to the source of electrical power such as batteries 78 and 80. Housing 14 is generally L-shaped and includes a generally cylindrically-shaped elongated leg 25 and a somewhat rectangularly-shaped shorter leg 24 extending from leg 25. Leg 24 mounts lens 50, reflector 90, and bulb 92. Housing 12 includes a bore 13 and leg 25 of

housing 14 includes a similar bore 15. One end of flexible core 16 is inserted into bore 15 and the other end is inserted into bore 13. Each end of core 16 has an anchor 22 to be more fully described hereinafter which is inserted into one of the bores 13, 15 for joining flexible core 18 to housings 12 and 14.

Referring primarily to Figures 2-10, additional features of flashlight 10 shall now be described in detail. Flexible core 16 includes an outer resilient sleeve 18 made from a resilient elastomeric material such as a thermoplastic rubber sold by the Monsanto Corporation under the trademark "SANTOPRENE". Referring particularly to Figure 4 a flexible spine 28 is contained within sleeve 18. Spine 28 comprises a plurality of interconnected universally rotatable members. Each universally rotatable member comprises a male end portion 28A and a female end portion 28B. The male end portion 28A has an outer surface comprising a frustum of a sphere and the female end portion 28B has a mating inner surface comprising a frustum of a sphere which is dimensioned so that, when the male end portion 28A is inserted into the female end portion 28B, there is frictional contact between the mating outer and inner surfaces 28A and 28B. These frictional forces function as retaining means to hold one member of the flexible spine 28 at any desired location relative to an inter-connected member. These frictional forces may be overcome which permits inter-connected members to be moved relative to each other so that their longitudinal axes may either be in or out of alignment. The interconnected segments have relatively unrestricted rotational movement therebetween. The segments of the flexible spine 28 are produced by Lockwood Products, Inc. and are made from acetal plastic or other suitable material. Electrical conductors 54 and 56 are disposed within flexible spine 28. One end of conductors 54, 56 is connected to housing 12 and the other end of the conductors is connected to working end housing 14. Sleeve 18 provides a protective cover over spine 28. The sleeve maintains an attractive appearance of the flashlight even when the individual members of spine 28 are skewed relative to each other.

An anchor 22 is connected to each end of flexible core 16. One of the anchors is inserted into bore 13 of housing 12 and the other of the anchors is inserted into bore 15 of housing 14. Anchor 22 includes a ball portion 64, a main body portion 66 which includes a plurality of upstanding ribs 34 and a somewhat rectangularly shaped portion 30. The height of centre rib 34A is somewhat greater when compared to the height of the other ribs 34 of each anchor 22. As will be more fully described hereinafter, portion 30 has an open end facing away from body portion 66 for receiving strain relief 32 therewithin. Each rib 34 includes a ramp-like leading surface 34B for expanding the material of sleeve 18 outwardly to enable each end of the sleeve to be emplaced about an anchor.

Strain relief 32 includes a pair of longitudinally spaced slots 47. Strain relief 32 mounted within housing 14 receives contacts 36, 38 in slots 47 while strain relief 32 mounted in housing 12 receives contacts 42, 46 in

slots 47. The strain relief electrically connects conductors 54, 56 to the contacts in each housing 12, 14. Contact 42 in housing 12 is, in turn, connected to negative strip conductor 45 while contact 42 is connected to positive conductor 44 (See Figure 3). Conductors 44 and 45 are, in turn, connected to batteries 78 and 80. Housing 12 includes a removable battery cap 40. Contacts 36, 38 are connected to conductors 58, 60 in housing 14.

As shown, switch 20 is in series with conductor 58. As is known to those skilled in the art, switch 20 is normally open and is closed to connect bulb 92 to batteries 78, 80 via the various electrical conductors and contacts noted previously.

Referring specifically to Figures 1 and 6, one of the housings, for example housing 12 includes an upstanding rib 26. Rib 26 includes a relatively thin elongated portion 27 connected to a relatively wide elongated portion 29. The other of the housings, for example housing 14 includes a groove 68 whose length is generally coextensive with the length of upstanding rib 26. Groove 68 is generally U-shaped and includes a pair of spring clips 52. Spring clips 52 are laced within groove 68 in a portion which overlies relatively narrow portion 27 of rib 26. If it is desired to reduce the overall length of flashlight 10, for example, for storage purposes, or for holding the flashlight for use in a conventional hand-held manner, core 16 is folded so that the core forms a generally U-shape so that housing 12 lies in the same vertical plane as housing 14. As shown specifically in Figure 6, when core 16 is folded as described, rib 26 underlies U-shaped groove 68. To join the two housings together, rib 26 is snapped into groove 68. Relatively narrow portion 27 of rib 26 is inserted between the opposed faces of spring clips 52 which forces the opposed faces outwardly. When the rib is inserted into the grooves the opposed faces of the spring clip are forced inwardly to lock the rib within groove 68 to positively join the two housings together.

As described previously, each end of flexible core 16 includes an anchor 22. One of the anchors is inserted into bore 13 and the other of the anchors is inserted into bore 15. During testing, it has been found that twisting or turning the flexible core to obtain a desired configuration for the flashlight produces forces which tend to pull the sleeve from either or both bores of the housings or twist either end of sleeve 18 relative to bores 13 or 15. To prevent the undesired occurrence of the separation of sleeve 18 from one or both housings and the undesired twisting of sleeve 10 relative to the housings, grasping means, to be more fully described hereinafter, have been added to both bores 13, 15 and anchors 22.

Referring specifically to Figures 11-14, each bore 13, 15 is provided with a plurality of circumferentially spaced inwardly extending ridges respectively 100 and 102. Ridges 100 and 102 extend radially inwardly towards the surface of sleeve 18. In addition, each bore includes a pair of 180° circumferentially spaced grooves 104 which underlie ribs 34A when each anchor 22 is placed in a respective bore 13, 15.

Housing 14 includes four circumferentially spaced ridges 100 whereas housing 12 includes 12 circumferentially spaced ridges 102 which ridges extend in circumferential direction. The length of each ridge 100 is greater than the length of each ridge 102. As shown in Figure 13, the cross-sectional shape of each ridge 100 (or 102) is similar to a shark's tooth so that the outer surface of the sleeve engaged by each ridge 100, 102 is firmly grasped to sandwich the sleeve between the outer surface of anchor 22 and the outer surface of each ridge. This arrangement prevents the sleeve from being twisted relative to each bore 13, 15 and prevents the sleeve from being separated from one or the other of housings 12, 14.

To further prevent any undesired twisting or longitudinal movement of the sleeve, ribs 34A act to force the resilient material of sleeve 18 into the underlying grooves 104. The combination of ribs 34A and grooves 104 further prevents twisting of sleeve 18.

A further feature of the flashlight relates to strain relief 32. Strain relief 32 includes a hub portion 48 having a relatively enlarged boss 48A formed at one end of the hub. The other end of the hub does not have an enlarged boss similar to boss 48A and the end of the hub lies in the same vertical plane relative to the vertical plane of the end face of body portion 30 of anchor 22.

Each housing 12, 14, includes a relatively large inwardly extending boss 69 and a second circumferentially spaced relatively smaller boss 69A. When each anchor 22 and its associated strain relief 32 is inserted into one of the bores 13, 15, enlarged boss 48A of strain relief 32 is aligned with relatively smaller boss 69A of the housing and the flat surface 48B of the hub is aligned with relatively large boss 69 of the housing. In effect, the strain relief can only be inserted within the bore in one position due to the relationships established by bosses 48A, 69A and 69B and the flat surface 48B of hub 48. The foregoing enables anchor 22 and strain relief 32 to be used with a polarised plug. A screw 67 or similar means is inserted through boss 69, hub 48 and boss 69A to affix each anchor 22 to its respective housing.

Claims

1. Flashlight comprising:

- a base housing (12) forming a power end for the flashlight and having a longitudinally extending bore (13) for receiving at least one battery (78, 80),
- a working end housing (14) spaced from the base housing (12) and supporting a light bulb (92) wherein the working end housing (14) includes means defining a longitudinally extending bore (15), and
- a flexible core assembly (16) connecting the base housing (12) to the working end housing (14), and comprising a pair of conductive wires

(54, 56) electrically connecting the battery (78, 80) to the light bulb (92), a flexible spine (28) and a resilient sleeve (18) containing the spine (28),

characterized in that the flexible spine (28) includes a plurality of interconnected and universally rotatable members, that to at least one end of the flexible core assembly (16) an anchor (22) is connected having a portion extending within the bore (13; 15) of the corresponding housing (12; 14) and that this bore (13; 15) includes gripping means (100; 102) sandwiching the sleeve (18) between themselves and the anchor (22).

2. Flashlight according to claim 1, characterized in that to each end of the flexible core assembly (16) an anchor (22) is connected.
3. Flashlight according to claim 1 or 2, characterized in that the anchor (22) is connected to the end of the spine (28).
4. Flashlight according to one of claims 1 to 3, characterized in that said gripping means comprise a plurality of radially inwardly extending ridges (100, 102) engaging the outer surface of the sleeve (18).
5. Flashlight according to claim 4, characterized in that said ridges (100; 102) in vertical cross-section have a shark tooth-like shape.
6. Flashlight according to claim 4 or 5, characterized in that said ridges (100; 102) extend in circumferential direction.
7. Flashlight according to one of claims 4 to 6, characterized in that said ridges (100; 102) are spaced in circumferential direction.
8. Flashlight according to one of claims 1 to 7, characterized in that the anchor (22) has first locking means (34a) and the bore (13; 15) of the housing (12; 14) includes second locking means (104) which maintain the flexible sleeve (18) sandwiched against relative displacement in circumferential displacement.
9. Flashlight according to claim 8, characterized in that the first locking means comprise a longitudinally extending rib (34a) and that the second locking means are formed by a complementary concave surface (104).
10. Flashlight according to one of claims 1 to 9, characterized in that the wires (54, 56) are contained in the spine (28).

11. Flashlight according to one of claims 1 to 10, characterized in that at the free end of the anchor (22) a boss (48A) is provided which is connected with bosses (69, 69A) provided in the housing (12; 14) by means of a screw (67).
